

PIERCING AFTERCARE

For questions or concerns during the healing process, please reach out to your artist.

STEP 1

Wash your hands thoroughly and then using the recommended saline solution - soak a non-woven gauze or cotton pad really well.

STEP 2

Fold the gauze/cotton around the piercing and hold it there for about 5 minutes to give the piercing a good soak.

STEP 3

Once the five minutes is up, you'll want to take the corner of your gauze and wipe around and underneath the piercing, both in front and behind, to remove any loose build-up.

STEP 4

Lastly, make sure you dry the piercing really well. Moisture is the perfect place for bacteria to hang out and we want to avoid that.

Clean your piercing daily until it is fully healed. This could be anywhere from 3 months up to 1 year.

Wash your hands before cleaning your piercing. Our fingers and hands contain bacteria that we don't want in the piercing.

Always use the recommended saline solution for cleaning. DO NOT use alcohol, bactine or neosporine, as this could dry out the skin around your piercing.

Do not rotate the jewelry or remove your jewelry as it will start to close immediately.

AVOID:

lotions, creams, makeup, serums or perfumes directly on the piercing
